It is an online forum for Indian Pharmacy Professionals. Its primary objective is to facilitate the exchange of professional experiences and information in the area of Pharmacy in India and other Q: How to run VBA in a loop with given values for each loop? Is it possible to have a loop which does something like this? For i = 0 to 4 If i = 5 Then 'do something Else 'do nothing End If Next I'm aware that I can do this: However this is a bit of a waste and there's no need to write all this code every time I need to do this. A: You can simply use a For loop with a Counter that will repeat the same amount of times (stored in a variable). If however, you want to use a counter you could use the modulus (%) operator to define a variable that will iterate a number of times. The modulus operator will reduce the starting value to the remainder. For i = 0 To 100 Step 5 Q: Equivalent of "delayed" semantics in C I have a C struct like the following: struct Foo { int foo; float bar; }; I want to apply a certain struct transformation to the struct in a place where I don't have direct control over it. I'm currently doing something like this (pseudo-code): struct Foo first_struct, second_struct; first_struct.foo = 42; do_something(&first_struct, 82157476af
